Common Record Layout

VOLUME II
SECTION
3

This section provides the Common Record layout table, which lists the valid tags that can be used in XML Schema version 3.0d as well as their valid values. Additionally, this section provides standards for the physical layout of the Common Record XML Document file. Standards on the physical layout of the Common Record XML Document file are required to ensure all systems transmitting or processing an instance of the file can do so without encountering physical constraint errors.

Table of Contents

Introduction

This section provides the Common Record layout table, which lists block information grouped according to the following column headings:

- Field Number - Lists the Common Record field number

- COD Data Field – Contains the Common Record 2012-2013 tag name (Schema version 3.0d), and a description

- Maximum Length – Specifies the maximum length of the element

- Data Type – Specifies the type of field (e.g. date, integer, string, Boolean etc.)

- Field Type – Specifies whether the field is a simple or complex element

- Format and Valid Field Values – Describes the acceptable content for a given Common Record element

- Element Requirements for Various Business Processes - Indicates whether the field is required to perform the following functions:

    o P = Establish Pell Grant

    o A = Establish Academic Competitiveness Grant (ACG)

    o S = Establish National Science and Mathematics Access to Retain Talent (SMART) Grant

    o T = Establish TEACH Grant

    o DS = Establish DL Subsidized

    o DU = Establish DL Unsubsidized

    o DP = Establish DL PLUS

    o DB = Establish a disbursement for an award/loan

    o RS = Response

    These initials are also listed at the bottom of each page in the Layout Business Process Key.

Under each of the functions, an "R" indicates the field is required. An "O" indicates the field is optional to perform the function. "NA" indicates the field is not applicable to the function being referenced.

A field is considered Optional (O) when it is not required in all business processes; however it may be required in some business processes. For example, MPN Status Code is marked as Optional (O) in the Response (RS) column as it is not returned on Pell responses but is required to be returned on Direct Loan responses. Please consult Implementation Guide for more information on business scenarios in which specific tags need to be submitted.

The intent of this Technical Reference is to describe the purpose and use of the COD Process and the Common Record. XML Standards are not presented here and should be obtained from other sources. The following is a representation of the Common Record content, for example, data elements, valid values and maximum field lengths. It does not represent the physical layout of the data transmission. The layout is depicted in a separate document, the XML schema.

The COD system uses Version 2.0e of the Common Record XML schema for the 2006-2007, 2007-2008, and 2008-2009 award years. It is provided in a format that can be downloaded for printing or importing to another application.

Effective March 26, 2010, schools were required to use Version 3.0c of the Common Record XML schema for the 2010-2011 Award Year.

Effective February, 2011, schools must use Version 3.0d of the Common Record XML schema for the 2011-2012 Award Year

Beginning in March 2012, schools must use Version 3.0e of the Common Record XML schema for the 2012-2013 Award Year.

The Common Record Layout lists elements in block sequence. A general rule regarding sequence of data within blocks, and within complex elements: the start and end data tags and their context must be presented on the XML document within the block's tags or the complex element tags to which they belong. The sequence of the data within that block or element is dictated by the sequence of the data tags presented in the XML schema. The Common Record Layout does not attempt to depict the order or sequence of tags. For example, if a complex element has ten simple elements within it, those ten elements must occur in the same sequence as depicted in the XML schema. If there is any discrepancy between the information presented here and the information presented in the XML schema, the XML Schema should be considered as the correct source for the information.

Required Fields

Refer to the *Minimum Data Elements Required for Document Processing* topic in *Volume II, Section 1 – Implementation Guide* for more information.

DLGraduate PLUS Block

The Common Record XML Schema 3.0d includes a DL Graduate PLUS Block. This block is reserved for future use and will not be used for processing. As such, schools should not use the DL Graduate PLUS Block for Direct PLUS Loans made to eligible graduate and professional students.

Schema Version 3.0e Common Record Layout

Beginning in March 2012, the COD System will be updated to support Schema version 3.0e. Schema 3.0e includes the addition of the `<EnrollmentSchoolCodeTag>` and a new value of 'E' for the `<MPNStatusCode>`. Schema 3.0e also modifies fields to eliminate leading zeros on response files sent from the COD System. The full list of the fields which will no longer contain leading zeros is available on IFAP with the published 3.0e schema (http://www.ifap.ed.gov/codxmlschema/CODXMLSchema3pt0e.html).

System-Generated Responses

Beginning February 2011, all Common Record documents for the 2011-2012 Award Year and forward must be sent by schools and will be acknowledged by the COD System using COD Common Record XML Schema Version 3.0e System-generated responses include the following:

- BN   Booking Notification

- CO   Credit Decision Override

- ND   Negative Disbursement

- PS   Payment to Servicing

- PN   Promissory Note

- AT   Agreement to Serve

- EC   Entrance Counseling

- SP   PLUS Application Acknowledgement

Changes to Disbursement Block

Schema version 3.0e will include changes to the `disbursement Block` for Pell, DL, and TEACH. The following tags have been added

- `<EnrollmentSchoolCode>`

  - This tag did not exist for the `Disbursement Block` prior to schema version 3.0e.

This page intentionally left blank

Document Information

Field #	COD Data Field	Max Length	Data Type	Field Type	Format and Valid Field Values	Element Requirements for Various Business Processes									
						P	A	S	T	DS	DU	DP	DB	RC	RS
1.	**<CommonRecord xmlns=" ">** **Common Record:** The root element for the document. The attribute: "xmlns", and its value: http://www.ed.gov/FSA/COD/2010/v3.0d, are together used to indicate the namespace of the elements in the XML document. The namespace convention COD incorporates the schema version indicator. The version indicator is the "/v3.0d" component of the namespace. When schema updates are made, the version indicator must reflect the update (e.g., "/v3.0c", "/v3.0d"). This attribute and value are required on all transmissions.	NA	NA	Complex Element with Attribute	NA	R	R	R	R	R	R	R	R	R	R
2.	**<TransmissionData>** **TransmissionData:** Nested immediately below the Common Record element, it contains the DocumentID, CreatedDateTime, Source, Destination, Software, and FullResponseCode	NA	NA	Complex Element	NA	R	R	R	R	R	R	R	R	R	R
3.	**<DocumentID>** **Document ID:** The Date and Time stamp with the Source Entity ID. This tag maps to the Pell Batch ID and the Direct Loan Origination Batch Identifier, the Disbursement Batch Number, and the Change Batch Identifier.	30	string	Simple Element	CCYY-MM-DDTHH:mm:ss.ff99999999 Once initial information is submitted to COD, new content cannot overwrite the database.	R	R	R	R	R	R	R	R	R	R
4.	**<CreatedDateTime>** **Created Date and Time**: The Date and Time stamp when the document was created.	22	date/ time	Simple Element	CCYY-MM-DDTHH:mm:ss.ff For 2012-2013 awards, the valid date range is from 2012-01-01 to 2014-10-05. Once initial information is submitted to COD, new content cannot overwrite the database.	R	R	R	R	R	R	R	R	R	R
5.	**<Source>** **Source:** This element provides a logical grouping of elements related to Document Information.	NA	NA	Complex Element	NA Once initial information is submitted to COD, new content cannot overwrite the database.	R	R	R	R	R	R	R	R	R	R
6.	**<Destination>** **Destination:** This element provides a logical grouping of elements related to Document Information.	NA	NA	Complex Element	NA Once initial information is submitted to COD, new content cannot overwrite the database.	R	R	R	R	R	R	R	R	R	R

Common Record Physical Layout

This section provides standards for the physical layout of the Common Record XML Document file. Standards on the physical layout of the Common Record XML Document file are required to ensure all systems transmitting or processing an instance of the file can do so without encountering physical constraint errors.

Examples of physical constraint errors include: exceeding available memory, exceeding available disk space, or exceeding available network bandwidth (and timing out). While most physical constraint errors can be avoided by proper coding techniques on the host system, there are some error conditions best handled through the definition of, and adherence to, a set of well-defined and well-publicized standards. Such error conditions and their corresponding standards for resolution are provided in this section.

XML and its associated technologies, (XML Schema, Document Type Definitions), do not provide for a mechanism to define the physical layout of a file. In fact, XML does not depend on the physical layout of the elements by design. White space and line lengths are not relevant to the logical construction and reading of an XML document. Therefore, the Common Record XML file physical layout standards are defined as guidelines and examples presented in this Section.

Line Length Limitations

32-kilobyte Line Length Limitation on Mainframe System

Some mainframe systems cannot create or read a line longer than 32 kilobytes. A line consists of a string of data with an "end of line marker." The phrase "end of line marker" in this document refers to whatever mechanism is used on a platform to terminate an individual line or record. For example, an end of line marker can be set by the writing out of a record (on a mainframe), by inserting a <CR><LF> character sequence (on a PC), or by inserting a <CR> character (on UNIX). <CR> (carriage return character) and <LF> (linefeed) are ASCII codes 13 and 10, respectively.

Systems with this limitation cannot handle a string of data longer than 32 kilobytes without encountering some type of data corruption (most likely truncation). By rule, XML ignores white space, which includes tabs, linefeeds, and carriage returns. Since XML has no means to regulate line lengths, a separate standard must be set to ensure lines do not exceed 32 kilobytes.

9,999-byte Line Length Limitation on COD System

The COD System cannot process documents that contain over 9,999 bytes per line. A line consists of a string of data with an "end of line marker." The phrase "end of line marker" in this document refers to

whatever mechanism is used on a platform to terminate an individual line or record. For example, an end of line marker can be set by the writing out of a record (on a mainframe), by inserting a `<CR><LF>` character sequence (on a PC), or by inserting a `<CR>` character (on UNIX). `<CR>` (carriage return character) and `<LF>` (linefeed) are ASCII codes 13 and 10, respectively. COD will not process or acknowledge Common Record Documents that are submitted with a string of data greater than 4,000 bytes.

Line Length Limitation Solution

The solution, in its general form, is to make sure an end of line marker is always set before a particular output stream of data reaches 9,999 bytes. This end of line marker should be created in the format native to the system where the file is being created.

The data transmission software used by COD and by participating schools handles the translation of end of line markers across platforms. For example, if a file were sent from a PC to a UNIX box, the `<CR><LF>` character sequence would be automatically changed to `<CR>` characters. Therefore, the insertion of an end of line marker does not have to take into consideration the platform of the destination system. This same principle holds true between mainframes (EBCDIC or ASCII), PCs and UNIX boxes.

Standard

In order to ensure no line grows larger than 9,999 bytes, all Common Record XML files submitted to COD should be constructed with end of line markers inserted at specified points in the document. These points are tied to specific elements in the XML document. The points are:

> The following standard is a strongly recommended approach for schools and vendors who want to guarantee their files will not exceed the 9,999 byte limitation. If a school or vendor can ensure their submitted files will not exceed the 9,999 byte limitation by some other means, those files will be accepted by COD. However, the burden of responsibility will then rest with the school or vendor for files incorrectly submitted.

- After the AttendedSchool element opening tag, `<AttendedSchool>`

- After every Student element closing tag, `</Student>`

- Before beginning an "Award" element opening tag, which could be `<Pell>`, `<AcademicCompetitivenessGrant>`, `<NationalSMARTGrant>`, `<TEACH>`, `<DLSubsidized>`, `<DLUnsubsidized>`, `<DLPLUS>`, and the opening tags of all other elements designated as part of the Award substitution group in the Common Record XML Schema specification

- Before beginning a Disbursement element opening tag, `<Disbursement>`, for every disbursement under each of the "Award" elements listed above.

The Common Record XML Schema has been evaluated to confirm that if the above standard is maintained, the maximum size of the data sent in any one of these lines will never exceed 9,999 bytes. The maximum line size takes into account all tags, all maximum data lengths for each element, and all maximum numbers of repetitions of nested data elements.

The following example found is a skeleton submission file correctly formatted according to the end of line marker standards. In this example, for clarity, sub-elements are not listed, and the characters, [EOL], explicitly mark the end of a line.

Common Record Response File Options

For more information on the length of COD Response Files, please refer to the School Options topic in *Volume II, Section 1 – Implementation Guide* for more information.

COD guarantees the Response Document files it produces will not contain lines longer than 9,999 bytes, but the files will not necessarily match the line breaks as specified for submissions. This is due in part to the additional space used by the Response blocks.

Coding Guidelines

The code should track the Common Record elements as they are written to the output stream and write out a line of XML text (via the appropriate end of line marker) as any of the EOL points are encountered. Code to construct the Common Record can vary greatly depending on the platform, libraries, and languages used, so specific examples are not provided.

```
